

NEXORA Demo Script

AI-Powered Construction Procurement & Supply Chain Intelligence Platform

Introduction

Hello everyone,

I'm Ashish Kumar, a student in the IIT Madras BS Degree Programme, and this is **NEXORA**, an AI-Powered Construction Procurement & Supply Chain Intelligence Platform built for the Kaya AI India Hackathon 2026.

Construction companies manage purchase orders, invoices, contracts, vendor documents, and logistics records manually. NEXORA uses AI to automate document understanding, procurement intelligence, and supply chain decision-making.

Landing Page

The landing page introduces NEXORA and highlights AI Document Intelligence, Supply Chain Monitoring, Predictive Analytics, Smart Procurement, Risk Detection, and the AI Copilot.

Dashboard

The live dashboard provides procurement KPIs, vendor statistics, delivery performance, AI analytics, risk alerts, and an AI Copilot that helps project managers make faster decisions.

AI Document Intelligence

Users upload purchase orders, invoices, contracts, and BOQs. OCR and AI extract structured information including vendor details, PO numbers, delivery dates, materials, and amounts.

Risk Analysis

The Procurement Risk Engine evaluates vendor reliability, delivery probability, cost overruns, and procurement risks. The AI Recommendation Engine suggests approval decisions and backup vendors.

Architecture

The frontend is built using React, TypeScript, Vite, and Tailwind CSS. The planned backend uses Python and Flask with OCR, LLMs, predictive analytics, and a database to deliver intelligent procurement insights.

Future Roadmap

Future enhancements include ERP integration, BIM support, AI Contract Review, Predictive Cost Analytics, Multi-language OCR, Mobile Apps, and Construction Digital Twin support.

Closing

NEXORA demonstrates how AI can simplify construction procurement by automating document analysis, predicting risks, improving supply chain visibility, and enabling smarter decisions.

Thank you for watching!
